

Acuaiss moisturizing eye drops

More and more people are suffering from irritation, discomfort and itchy eyes caused by air conditioning, excessive computer use, poor indoor air quality and other external agents.

Acuaiss is the final remedy to fight these symptoms. Its new formulation, containing sodium hyaluronate, known for its regenerative properties, moisturises, oxygenates and soothes the eyes instantly.

Thanks to its smooth texture, it may be applied to any eyes, even extremely sensitive ones, and may be used by persons wearing contact lenses.

With its practical multidose 6 ml bottle, Acuaiss can be most conveniently applied.

Product description

Acuaiss is a humectant solution containing sodium hyaluronate as active principle.

Sodium hyaluronate is a constituent part of the ocular structure having the property of stabilising the tear film thereby increasing eye comfort and reducing the sensation of dryness.

This preparation has viscoelastic properties.

When the product is instilled into the eye, the tendency of tears to break up is reduced because they become resilient (viscous) while being, at the same time, fluid when the eye blinks.

This property arises from the presence of sodium hyaluronate.

Indications

These humectant drops are specially indicated for the following circumstances:

■ Eye-straining activities, such as working at a computer, prolonged reading, etc. Namely, activities which reduce blinking frequency, making it advisable to improve the quality of tears.

■ Air conditioning, heat, in the work place.

■ Poor indoor air quality, air pollution.

■ For contact lens users. In sum, situations in which the environment or external agents may induce tear evaporation causing a sensation of pricking or discomfort.

Properties

The active principle, sodium hyaluronate, has the property of holding back the water in the tears (approximately 98% of the tear is water).

This property lessens the effects of reduced tear production.

The causes for a reduction in tear production, which may be removed partially or completely by using this product, are as follows:

■ Dry eye (poor tear production).

■ Conjunctival injection.

■ Red eye.

■ Sensation of discomfort and pricking after using the computer, TV, reading for a long time (tired eyes).

The properties of these humectant drops are:

■ Increase in the stability of the tear film.

■ Increase in corneal wettability.

■ Decrease in tear evaporation.

Biocompatibility

Studies on secondary eye tolerance and cytotoxicity reveal that the product is biocompatible. Allergic reactions are very unlikely, since this molecule is normally found in the human body: the sodium

hyaluronate used here is not of animal origin, and its chemical structure, molecular weight and viscosity are similar to those of the hyaluronic acid found in the human eye.
